

# supermarket management system

This is a supermarket management system you can do CRUD operation in (products, employees, users, categories, supplier company, incoming and out going), and don't worry if you enter invalid data, the system will alert you and no invalid data will be sorted.

There is also a cashier page and page to supplying products to supermarket which you can add product barcode and stock which you will sell it or add it to your supermarket, details of current order will be saved if you leave page without cancel or complete the order, if you want to cancel order or remove one or more element from it you can click remove on item you want to remove it, and if you want to complete the order just click at cash button, you can add any item from your supermarket to current order without refresh the page because we use AJAX (request and response) between backend and front end.

There are many features I don't mention it, I will let you to discover it 😊

In our system we have two types of users Admin and Cashier, admin can take control of everything, but cashier have number of pages can only access it.

Cashier can make order and add (product, category , company, incoming, outgoing)
